INTRODUCTION

Legal Management system is a digital portal for law practice. It is a platform where lawyers can manage their clients and their matters. Due to enormous different cases, the old paper-holic system is not serving as the way it should do. It is not maintainable and preferable now. Lawyers can handle each type of clients including their matter (one can have multiple matters too), documents, hearings, invoices, appointments, court judgments or others tasks. The purpose is to bring comfort to lawyers who can serve the affected people or clients in a better and organized way. Documents related actions must be authorized for data security. Key dates can also be recorded or shared with clients for better communication. Leads or contacts are the persons who will be the upcoming clients of a lawyer. Acts and courts can be added. General Settings are available to make site more dynamic.

METHODOLOGY

Approach: Agile Development

Pattern: MVC

TECHNOLOGY

Backend: Laravel

Frontend: Blade (HTML, CSS, Bootstrap, JQuery)

Database: MySQL

Deploy: Apache (Sub-Domain)

MODULES

- **Clients**

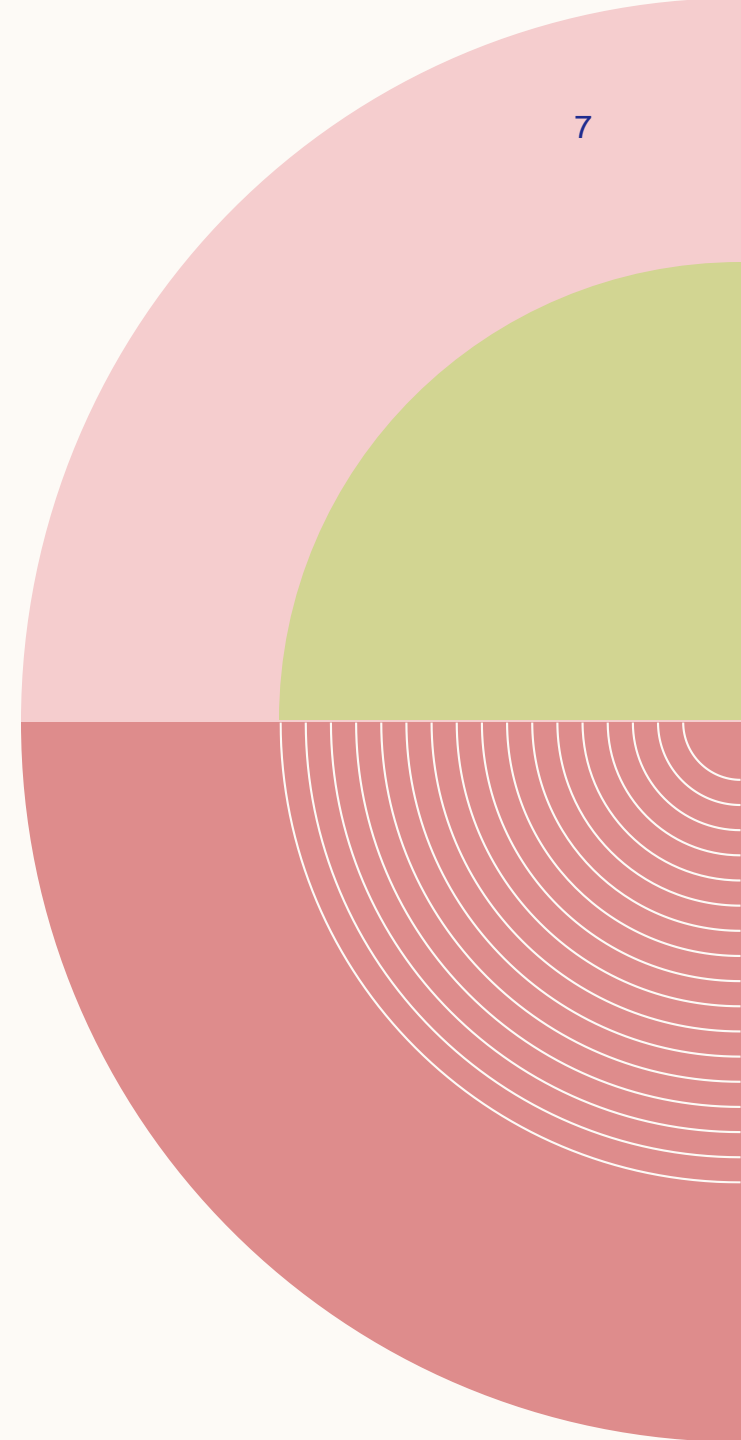

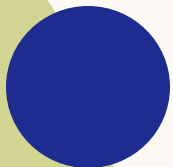

Clients are the initial and important part of system. There are two primary types of client. All other are secondary types created on behalf of these primary types.

- Plaintiff
- Accused

MODULES

- **Matters (Cases)**

Matters are added against clients. Multiple documents can be uploaded in each case. Appointments can be set for a case. Key dates like judgment date, hearing date, case closing date can be maintained. A court for a specific case can be changed. Case categories and stages are there for searching purpose.
